

CenturyLink® Private Line Service (PLS)

Carrier Class Network for Private Line Service (PLS)

CenturyLink's PLS is a dedicated, reliable, standards-based, point-to-point or point-to-multipoint transmission service that will provide agencies with full duplex bandwidth (DS0 through OC-192) transport service between two or more SDP locations as specified by GSA in support of mission critical applications such as voice, data, video, multimedia, and encrypted communications. CenturyLink's mature, premium quality private line data transmission service provides an agency the ability to implement PLS with either routine or critical service level availability.

Product Description

CenturyLink's PLS provides dedicated transmission paths between two or more federal customer SDPs in CONUS, OCONUS, and non-domestic locations. CenturyLink's PLS provides agencies with dedicated and secure full duplex bandwidth and transmission connectivity between two or more SDPs and will interoperate with government specified termination equipment at the SDPs such as PBXs, multiplexers, routers, video codecs, and group 4 FAX. As a standards-based offering, CenturyLink's PLS offering is compliant with all listed standards, and makes connection to, and interoperability with, other networks possible. CenturyLink's PLS is user protocol and application independent, enabling an array of diverse requirements and end-to-end (system or application) interoperability. Our PLS uses fiber link redundancy and a self-healing ring topology to provide the transport of DS0 and channelized or un-channelized T1 through OC-48 connections.

Highlights

- Tools for design, development, testing, hosting
- Compliant with all listed standards
- Extensive security features: physical security, monitoring/logging, update management, antivirus/antimalware, penetration testing, DDoS, encryption

KEY FEATURES

- CenturyLink supports multipoint PLS connectivity for the interconnection of three or more subscriber SDPs in a branch-off mode.
- Connects and interoperates with a myriad of SDPs
- Full duplex transmission connectivity between two or more SDPs
- Uses fiber link redundancy and a self-healing ring topology
